Coding Questions

Create a GitHub file for the solutions and then add the link in answer section

1. DOM Manipulation: Create a page with a square box of size 300x300 on the page which will be red initially, upon clicking the red box it should change the color to yellow and the size should be doubled 5 points

Your answer

2. Create a app where you have an input box and whenever a user types something in the input box and hits submit it should be added on the webpage below the input box 5 points

Your answer

3. Fetch data from the JSON placeholder API and display it in the browser. Also, implement the skeleton loader which will be displayed when the data is getting fetched. (No library should be used for implementing the skeleton loader) 10 points

Your answer

4. Build a responsive Navbar, on smaller screens it should be a hamburger menu which on click should reveal the menu items nicely, and on larger screens they should be displayed directly on the screen. 10 points

Your answer

5. Create a form with proper form validation using JavaScript (name, email, phone number, password, age, gender, date, color picker) 10 points

Your answer

6. Create a custom modal window using HTML, CSS, and JavaScript. On clicking a button the modal window should appear and the user can click outside the modal window to close the modal along with a close button which is inside the modal. Also when the modal is open the window should not be scrollable. 10 points

Your answer
